(*) Azul provides two types of distribution packages for each Java version:

- **SA** distributions are tested, certified, and commercially supported Azul Zulu Builds of OpenJDK. Azul ensures that the software that uses the Accessible APIs of the product doesn't have to include specific licenses and that such use doesn't contaminate the code or intellectual property of such software with any license requirements.
- **CA** are Azul Zulu Builds of OpenJDK that are free to download and use.

NOTE

Both SA and CA distributions may contain Early Access builds noted with `-ea-` in their filename. Early Access builds may not be TCK certified.

(**) Update type:

- **CPU** (Critical Patch Updates) contain fixes to security vulnerabilities and critical bug fixes. Azul Zulu CPU releases are generally based on prior-cycle PSU releases, with only security fixes applied. They provide a low-risk vehicle for the potentially urgent deployment of security fixes when issues of sufficient severity arise. CPU releases are available in SA distributions.
- **PSU** (Patch Set Updates) incorporates all fixes in the corresponding CPU, as well as additional non-security bug fixes. Azul Zulu PSU releases incorporate both security fixes and other changes that align the release contents with the associated OpenJDK project quarterly release. PSU releases are available in SA and CA distributions.

What's New

JavaFX Support for Linux on ARM 64-bit

With this release, Azul Zulu Builds of OpenJDK with bundled support for JavaFX are available for Linux on ARM 64-bit for versions 8, 11, 17, 21, and 22.

Support for Windows aarch64

Azul Zulu Builds of OpenJDK, version 21, are now available for Windows ARM 64-bit systems.

Distroless Docker Image with Zulu 21

Docker images with Azul Zulu Builds of OpenJDK are now available for [version 17 and 21 on Docker Hub](#).

Notification of Future Changes

In the next release (July 2024 Quarterly Update Release), the following configuration changes will be applied.

Reduced Testing

Azul will reduce the priority of testing Azul Zulu for the following environments:

- JavaFX support on CentOS 6
- Wind River Platform

That doesn't mean Azul won't accept support requests for Azul JDK on these platforms, you'll be fully covered even if you keep using them. However, it may mean that testing on these platforms will be reduced. If you're still using this platform, please let us know at support@azul.com.

Toolchain Change for macOS x86 64-bit

The toolchain used to build Azul Zulu Builds of OpenJDK, version 8 and 11 on macOS x86 64-bit, will be upgraded from Xcode 11.3.1 to Xcode 12.3.

Toolchain Change for Windows

After July 2024, Azul Zulu Builds, version 6 and 7, for Windows will be compiled with Microsoft Visual Studio 2017. This means that the builds will no longer include the `mscvr100.dll` library provided by the Microsoft Visual C++ 2010 SP1 Redistributable Package (x86/x64), which was included by default in earlier builds. Applications that depend on the presence of this dll in the JDK/JRE will fail to run with the new builds. There are two possible workarounds for this problem:

- Install Microsoft Visual C++ 2010 SP1 Redistributable Package.
- Rebuild the application using a modern version of Visual Studio.

Supported Platforms

This section provides information about the operating systems that are supported in this release of Azul Zulu.

Azul Zulu Builds of OpenJDK Without and With OpenJFX

Some versions of Azul Zulu are available in different packages for specific platforms, as indicated in this overview table with:

ID	Notes
1	This vulnerability applies to Java deployments that load and run untrusted code (e.g., code that comes from the internet) and rely on the Java sandbox for security. This vulnerability does not apply to Java deployments, typically in servers, that load and run only trusted code (e.g., code installed by an administrator).
2	This vulnerability can be exploited by using APIs in the specified Component, e.g., through a web service which supplies data to the APIs. This vulnerability also applies to Java deployments that load and run untrusted code (e.g., code that comes from the internet) and rely on the Java sandbox for security.
